Download and offline

Install Auric Artisan as an app, prepare it to work offline, keep it up to date, manage its storage, and remove it.

Auric Artisan is a **progressive web app** (PWA): a website that your browser can install like an app and keep working without an internet connection. There is nothing to download from an app store. You install it from the browser you already use, and it opens in its own window with its own icon.

The Download page at <https://auricartisan.com/download/> ("Install it. Then lose the connection") is where you install the app and, more importantly, prepare the **offline version**. Preparing it copies the site's pages, tools, libraries, palettes and data into your browser's storage while you are online, so that the workspace keeps working when you are not. You choose how much to keep with an **offline profile**: **Auto**, **Lite**, **Balanced** or **Full**. The page then shows exactly what is on your device: readiness checks, storage used, cached files and missing files, with buttons to audit, repair or reset the offline copy.

Nothing large is downloaded unless you ask. On a first visit, the browser keeps only a small core of the site (the app shell) so that an offline visit can still show something useful.

Who it is for

- People who work on trains, planes or unreliable connections.
- Anyone who wants Auric Artisan in its own window, on the dock, taskbar or home screen.
- Classrooms and studios that want tools available without depending on the network.

Where to find it

- <https://auricartisan.com/download/>
- Header: the **Browser PWA** icon (grid with a plus). Drawer: **The app** (Works offline in a browser tab).
- Spotlight: **Install the PWA** launcher, or the **Install the app** command.

Quick start

1. Open <https://auricartisan.com/download/> in Chrome, Edge or Safari while you are online.
2. Select **Prepare offline version**. The status line shows the download's progress, and a message reads "Saving for offline — N%".
3. When it finishes (the status line reads, for example, "Balanced offline download finished: A/B assets ready.", with real numbers), check that the **Readiness** badge reads **Offline ready**.
4. If an **Install app** button appears, select it and confirm your browser's install dialog. On an iPhone or iPad, use Safari's **Share** > **Add to Home Screen** instead.
5. Open the installed app from its icon. It opens in its own window.
6. Turn off your connection and open a tool. It still works.

What you can do

- Install the site as an app on Windows, macOS, Linux, ChromeOS, Android, iOS and iPadOS, where the browser offers it.
- Prepare an offline copy sized for your device, from the app shell up to the whole site.
- See what is cached, audit it, repair missing files, or reset it.
- Keep Hindi available offline.
- Get notified when an update is ready, and apply it.
- Open files and shared links with the installed app, and use its shortcuts.
- Remove the app and its offline data.

WEBSITE > DOWNLOAD AND OFFLINE

Get started with the app and offline use

A tour of the Download page and the three steps to a working offline copy.

Two separate things

- **Installing** puts Auric Artisan in its own window with an icon. Whether a browser offers this is the browser's decision.
- **Preparing the offline version** stores the site in your browser so it works without a connection. This works in any modern browser with a secure connection, installed or not.

You can do either, or both. For reliable offline use, prepare the offline version even if you install.

A tour of the Download page

Open <https://auricartisan.com/download/>. From top to bottom:

1. **The head.** "Auric Artisan · Browser PWA", the title **Install it. Then lose the connection**, one paragraph, and the actions:

- **Install app** (only when your browser offers installation);
- **Update app** (only when an update is waiting);
- **Prepare offline version**;
- **Download full offline**;
- **Open in browser** (to the homepage).

Below them, a **status line** says what is happening, with a progress bar.

2. **Readiness — Is this browser ready.** A badge (**Checking**, **Preparing**, **Shell ready** or **Offline ready**) and six checks: **Shell**, **Full cache**, **Persistent storage**, **Local capabilities**, **Install** and **Update**. Buttons: **Check readiness**, **Audit cache**, **Repair cache**, **Reset cache**.
3. **Live metrics — What is actually on this device.** Cache entries, storage used, CPU threads, graphics, offline profile, cache target, missing assets and the app version, then a list of **Browser capabilities**, and **Check local hardware**.
4. **Profile — How much to keep.** **Auto**, **Lite**, **Balanced** and **Full**, a switch to limit background work on low-power hardware, a summary, **Configure profile**, and a table of what each profile keeps.
5. **Offline workflow — Three steps, then you can close the Wi-Fi.** Prepare, Confirm, Work offline.
6. **Where it runs.** Windows, macOS, Linux, Android, iOS and iPadOS, and other devices, with your current platform marked "current".

The three steps

1. **Prepare.** While online, select **Prepare offline version**. The browser fills its offline store in the background; you can keep working.
2. **Confirm.** Check the readiness badge and the storage checks. Persistent storage matters: without it, the browser may clear the offline copy when the device runs short of space.
3. **Work offline.** Open cached tools and libraries from this browser, or from the installed app. Palettes and exports you make stay on the device.

Next steps

- [Install the app](#)
- [Prepare the offline version](#)
- [What works offline](#)

[WEBSITE](#) > [DOWNLOAD AND OFFLINE](#)

Install the app

Install Auric Artisan as an app on each platform the Download page covers, and what installing changes.

The same app runs on Windows, macOS, Linux, ChromeOS, Android, iOS and iPadOS. What differs is how you install it: whether a browser offers an install button is the browser's decision. The Download page marks your current platform with "current".

Using the Install app button

In browsers that offer installation to web pages (such as Chrome and Edge on desktop and Android), the Download page shows an **Install app** button.

1. Open <https://auricartisan.com/download/>.
2. Select **Install app**. The status reads "Opening the browser install prompt...".
3. Confirm in your browser's dialog.

Result	Status line
Installed	"App install accepted. Finishing setup..." and a message "Auric Artisan installed"
You cancelled	"Install dismissed. You can still cache offline tools."
Browser cannot install	"Install prompt is not available in this browser."

Once installed, the button reads **App installed** and is hidden, and the **Install** check reads "App is installed and running standalone." when you open the page in the app.

If there is no **Install app** button, use your browser's own install option below.

Windows

Install from **Microsoft Edge** or **Google Chrome**:

- **Edge**: select the app icon in the address bar, or **Settings and more (...)** > **Apps** > **Install this site as an app**.
- **Chrome**: select the install icon in the address bar, or the menu (**:**) > **Cast, save and share** > **Install page as app** (wording varies by version).

The app appears in the Start menu and can be pinned to the taskbar. It supports local storage, files, the clipboard and graphics acceleration.

macOS

- **Safari**: **File** > **Add to Dock**.
- **Chrome** or **Edge**: the install icon in the address bar, or the browser menu as on Windows.

The app appears in the Dock and Launchpad (Safari) or in the Applications folder (Chrome and Edge).

Linux

Install from a Chromium-family browser (Chrome, Edge, Chromium, Brave) using the install icon in the address bar or the browser menu. Firefox on desktop does not install web apps, but offline use works in any browser with service worker support, Firefox included.

ChromeOS

Use Chrome's install icon in the address bar, or the menu. The app appears in the launcher.

Android

Install from **Chrome** or another compatible browser: select **Install app** on the Download page, or open the browser menu (⋮) and choose **Install app** or **Add to Home screen**. The icon appears on your home screen and in the app drawer.

iOS and iPadOS

1. Open <https://auricartisan.com/download/> in **Safari**.
2. Select **Share**, then **Add to Home Screen**.
3. Confirm the name and select **Add**.

Offline use and storage work within the limits Safari places on them on mobile devices; see [Limits and accuracy](#).

Other devices

Any modern browser with service workers, on a secure (https) connection, can run the app and cache pages for offline use, even where it cannot be installed.

What installing changes

- Auric Artisan opens in its own window, without the browser's address bar, and appears among your apps.
- The app's name is **Auric Artisan** (short name **Auric**), with its own icon.
- Right-clicking or long-pressing the icon offers shortcuts to key pages (see [Installed app features](#)).
- Links to the site open in the app where the system supports it.

Installing does not by itself download the whole site. Prepare the offline version as well: see [Prepare the offline version](#).

Without the browser's toolbar, use the site's navigation dock for **Back**, **Forward** and **Reload** (see [Navigation dock](#)).

WEBSITE > DOWNLOAD AND OFFLINE

Installed app features

App shortcuts, opening files with the app, sharing to it, and how links behave once Auric Artisan is installed.

These work once Auric Artisan is installed, in systems and browsers that support them (mostly Chromium-based browsers such as Chrome and Edge, and Android).

App shortcuts

Right-click the app's icon on the taskbar or dock, or long-press it on Android, for shortcuts:

Shortcut	Opens
Palette Library	Saved and generated palettes
Gradient Library	Gradient collections
Basic Tools	The core colour tool workspace
Workspace	Saved local palettes, gradients, assets and exports
Analyzer	The website analyzer
Browser PWA	The Download page's offline controls

Open files with the app

The installed app can be chosen to open these file types, for example from your file manager's **Open with** menu:

Type	Extensions
JSON	.json
CSS	.css
CSV	.csv
Text and Markdown	.txt , .md
Images	.png , .jpg , .jpeg , .svg

The files open in your Workspace. A message reads "1 file ready" (or the number of files). Text files up to 500 KB and images up to 2 MB are read straight away; larger files are passed on to open later. If a file cannot be read, the message is "Could not open file".

Share to the app

On systems with a share menu (such as Android), you can share a link or text to **Auric Artisan**. It opens in your Workspace with what you shared.

Links

- Links to auricartisan.com can open in the installed app, and an already-open app window is reused.
 - The app registers two link types, `web+auric:` and `web+palette:`, which open the Workspace and the Palette Library, where the browser supports them.
-

Standalone window

The app opens without the browser's toolbar. Use the site's navigation dock for **Back**, **Forward** and **Reload**, and **Copy link** to share the page you are on.

WEBSITE > DOWNLOAD AND OFFLINE

Prepare the offline version

Choose an offline profile and download the site into your browser so it works without a connection.

What is stored automatically

On your first visit, your browser keeps a small core of the site, called the **app shell**: the main pages (such as the homepage, Download, the tools index, Basic Tools, the Colour Science Lab, the Personalization Generator, the colour libraries, Search and Security), the site's styles and scripts, and the offline page. That is enough for an offline visit to show something useful, but not the whole site.

Everything beyond the shell is downloaded only when you ask for it.

Choose a profile

On the Download page, under **Profile — How much to keep**:

Profile	Description on screen	What it keeps	Suits
Auto (default)	Device-aware cache choice	Chooses Lite, Balanced or Full from what the device reports	Almost everyone
Lite	Smallest offline footprint	The app shell and the core tools, and little else	Phones, tight storage, metered connections
Balanced	Core tools plus active libraries	Shell, core tools and the colour libraries and their data	A laptop you also use for other things

Profile	Description on screen	What it keeps	Suits
Full	Download the widest local cache	Every file the site lists for offline use	A desktop that will be offline for a while

Selecting **Lite**, **Balanced** or **Auto** only sets the profile ("Updated offline hardware profile."). Selecting **Full** sets it **and starts downloading** at once: "Full profile selected. Downloading the full offline cache..."

How Auto chooses

Condition	Auto picks
Limit background cache work on low-power hardware is on, the browser reports Data Saver, or the connection is 2G	Lite
4 or fewer processor threads, 4 GB or less memory, or less than about 650 MB of storage available to the site	Balanced
Otherwise	Full

The **Offline profile** metric and the summary (**Selected, Effective profile**) show the result, for example "Auto selected Balanced for this device."

Limit background work

The switch **Limit background cache work on low-power hardware** makes Auto choose **Lite**. Use it on older or battery-powered devices.

Download

- **Prepare offline version** downloads the profile in effect (your choice, or Auto's).
- **Download full offline** downloads the **Full** profile regardless of your choice.

While downloading:

- the status line reads, for example, "Downloading the Balanced offline profile into this browser..." and then "Preparing offline version: A/B checked, C cached, D failed." (with real numbers);
- a message at the edge of the screen reads "Saving for offline — N%";
- you can keep using the site, and it is best to keep the tab open until it finishes.

When it finishes:

- the status reads, for example, "Balanced offline download finished: A/B assets ready." (with "N failed" if some files could not be fetched);
- a message reads "Full offline app ready";
- the readiness badge reads **Offline ready** and the cache audit runs.

If files failed, select **Repair cache** to try them again (see [Storage and cache](#)).

Hindi offline

If the site is in Hindi when you prepare the offline version, the Hindi text is downloaded as well (about 11 MB). If you switch to Hindi later, prepare the offline version again to include it.

Persistent storage

When you prepare the offline version, the site asks the browser to keep its storage **persistent**, so that the browser does not clear it when the device runs low on space. Some browsers grant this automatically, some ask you, and some decide from how often you use the site. The **Persistent storage** check shows the result: "Persistent storage is active for this browser." or "Storage is best-effort until the browser grants persistence."

If the connection drops

If a download you started is interrupted, browsers that support background sync (such as Chrome and Edge) finish it when you are next online. Otherwise, select **Prepare offline version** again; files already stored are kept.

Data use

The Full profile is the whole site and can be large (more than 100 MB). On a metered or slow connection, choose **Lite** or **Balanced**, or wait for Wi-Fi.

The site does not start a large download until you have asked for an offline copy at least once. After that, in browsers that support background sync, it refreshes your offline copy in the background when a new version of the site is released, so that you are not left with an old copy.

WEBSITE > DOWNLOAD AND OFFLINE

Storage and cache

Read the readiness checks and live metrics, and audit, repair or reset the offline copy.

The Download page reads its figures from your browser itself: the offline store, the storage estimate and the browser's capabilities. Open it on the device you care about.

Readiness checks

Select **Check readiness** to refresh them.

Check	Possible states
Shell	"Service worker shell is preparing." / "Service worker shell is ready for cached navigation."

Check	Possible states
Full cache	"Full offline cache is not warmed yet." / "Run prepare offline version to warm every core route." / "Offline cache has warmed this device profile."
Persistent storage	"Persistent storage is active for this browser." / "Storage is best-effort until the browser grants persistence."
Local capabilities	The number of CPU threads available for local work
Install	Checking / available / not offered by this browser yet / installed and running standalone / accepted / dismissed / could not be opened
Update	See Updates

The badge sums it up: **Checking**, **Preparing**, **Shell ready** (the core is stored) or **Offline ready** (your profile is complete).

Live metrics

Metric	What it shows
Cache entries	How many files are stored
Storage used	Space used by the site, and the browser's quota for it (persistent or best effort)
Local CPU	Processor threads, and approximate device memory where reported
Graphics	WebGL 2, WebGL 1 or Canvas, and the graphics processor where reported
Offline profile	The profile in effect, for example "Auto selected Full for this device."
Cache target	How many files the profile holds
Missing assets	Files of the profile not yet stored (after an audit)
PWA version	The version of the site in your browser

Browser capabilities lists each feature as **Ready** or **Limited**: Service worker, Cache API, Persistent storage, IndexedDB, File access, Clipboard, Share, Camera input, EyeDropper, Workers, Graphics and Offline privacy (a secure connection). Select **Check local hardware** to refresh them.

Audit the offline copy

Select **Audit cache**. The site compares your store with the profile ("Auditing Balanced cache coverage...") and reports:

- "Cache audit passed. Offline profile is complete." with **Missing assets** at 0; or
- "Cache audit found missing assets. Repair cache can retry them." with the count and the first missing file.

Repair it

Select **Repair cache**. The site fetches any missing files of the profile ("Repairing the Balanced cache profile..."), then reports "Cache repair finished: A/B assets ready." and re-runs the audit. You need to be online.

Reset it

Select **Reset cache** to delete the site's offline store and rebuild the app shell: "Resetting browser PWA caches and rebuilding the shell..." then "PWA caches reset. Shell cache rebuilt." Use it if the offline copy seems out of date or damaged. Prepare the offline version again afterwards.

Reset cache does not delete your library, settings or recordings, which are kept separately in your browser.

How much space it takes

Storage depends on your profile. Lite is small; Balanced and Full can take from tens to more than a hundred megabytes. **Storage used** shows the real figure on your device.

WEBSITE > DOWNLOAD AND OFFLINE

Uninstall and remove data

Remove the installed app, and clear the offline copy and other data the site keeps in your browser.

Remove the installed app

Uninstalling is done by your browser or system. The usual ways:

- **Chrome or Edge (Windows, macOS, Linux, ChromeOS):** open the app, open its menu (: or ...) in the title bar, and choose **Uninstall Auric Artisan**. On Windows you can also use **Settings > Apps**.
- **Safari on macOS:** remove the app from the Dock and delete it from your Applications folder.
- **Android:** long-press the icon and choose **Uninstall** (or **Remove**), or use **App info**.
- **iOS and iPadOS:** long-press the icon, choose **Remove App**, then **Delete from Home Screen** (wording varies by version).

The exact wording depends on your browser and system version.

Remove the offline copy

Uninstalling the app may leave the offline copy and your other site data in the browser. To remove the offline copy:

1. Open <https://auricartisan.com/download/>.

2. Select **Reset cache**. The offline store is deleted and only the small app shell is rebuilt.

Remove everything

To remove all data the site keeps in this browser (the offline copy, your settings, your library, recordings, and preferences), clear the site data for auricartisan.com in your browser's settings, usually under **Privacy** or **Site settings**.

Important: Clearing site data deletes your local library items and recordings. Export or download anything you want to keep first.

WEBSITE > DOWNLOAD AND OFFLINE

Updates

How new versions of the site reach your browser and installed app, and how to apply them.

Auric Artisan updates itself from the website: there is no app store update. Each release has a version name, shown on the Download page as **PWA version** (for example **2026-09-24-pwa-303**).

How you find out

When your browser has downloaded a newer version in the background, it waits for you. You may see:

- a prompt, **Update ready** — "Refresh to use the newest offline cache." — with **Refresh** and **Later**;
- on the Download page, an **Update app** button in the head, the **Update** check reading "Update is ready.", and the summary's **Update action** saying the same;
- in the right-click menu, a highlighted **Update available** row (see [Context menu](#)).

Apply an update

- Select **Refresh** on the prompt, or **Update app** on the Download page ("Applying update..."). The page reloads on the new version.
- Or press **Ctrl** + **Shift** + **U**, or choose **Update website** in the right-click menu, which checks for an update and applies it.

Later closes the prompt; the update is applied the next time all the site's tabs and app windows are closed and reopened, or when you choose to apply it.

Check for an update

Open the Download page: it checks when it loads, and the **Update** check shows one of:

State	Meaning
Checking for updates.	A check is running
Offline app is current.	You have the latest version
Update is ready.	A newer version is waiting
Applying update.	The update is being applied
Update check is not available.	The browser cannot check (for example, no service worker)
Update check failed.	The check could not reach the site

Your offline copy after an update

After an update, files are fetched fresh as you use them. To bring the whole offline copy up to date at once, select **Prepare offline version** again; the readiness checks show whether it is complete. In browsers with background sync, an offline copy you asked for before is refreshed in the background.

The Update Kit also reports and applies website updates; see [Kits](#).

WEBSITE > DOWNLOAD AND OFFLINE

What works offline

What keeps working without a connection, what needs one, and what the offline page shows.

Works offline, once stored

After you prepare the offline version, these work without a connection, as far as your profile includes them:

- the pages and colour tools stored on the device;
- the colour libraries and their data (Balanced and Full);
- your library of saved palettes, gradients and exports, which lives on your device;
- site features such as the Settings panel, theme, the right-click menu, split view between stored pages, the recorder, eye rest and the screen saver;
- searching the site with Spotlight (the search index is part of the Balanced and Full profiles);
- Hindi, if it was included (see [Prepare the offline version](#)).

When you go offline, a message reads **Offline mode** and stays until the connection returns; then **Back online** appears.

Needs a connection

Anything that has to reach a server:

- signing in, your account, billing and anything synced to your account;
- the Analyzer's audits of live websites;
- the **Web** tab in Spotlight and web results on the search page;
- sending feedback (it is kept and sent when you are back online);
- installing or updating the app;
- pages and files you have not stored.

How pages are served

- **Pages** are fetched fresh from the network when you are online, and stored as you visit them. Offline, the stored copy is used.
- **Styles, scripts, images and library data** are served from storage when available and refreshed in the background.

So a page you have visited recently is usually available offline even without preparing the offline version, but only preparing it guarantees a complete set.

The offline page

If you open a page that is not stored while offline, the site shows **You are offline** instead of an error:

- a **No connection** badge (it changes to **Back online** when the connection returns);
- "That page wasn't saved before the connection dropped.";
- **You wanted** with the address you asked for;
- **Try again**, which reloads the page;
- **Saved on this device**, with a count such as "38 pages" and a list of every page stored on this device that opens right now, shortest addresses first.

If nothing is stored yet, it reads "Nothing saved on this device yet".

Troubleshooting the app and offline use

Fixes for common problems installing Auric Artisan, preparing it offline and keeping it up to date.

There is no Install app button

Why: the button appears only in browsers that let pages offer installation, such as Chrome and Edge. Safari and Firefox do not; the site is already installed; or the browser has decided not to offer it yet.

What to do: use your browser's own install option (see [Install the app](#)). On iPhone and iPad, use Safari's **Share > Add to Home Screen**. You can still prepare the offline version without installing.

"Install prompt is not available in this browser."

Why: the browser did not offer installation to the page, or you dismissed it recently.

What to do: use the browser menu to install, or try later.

"PWA runtime is still loading."

Why: the offline system starts after the page finishes loading.

What to do: wait a few seconds; if it does not clear, reload the page.

"Offline download could not start yet."

Why: the browser has not finished setting up the site's offline system, or service workers are blocked (for example in some private windows or by an extension).

What to do: reload the page and try again. Use a normal window, and make sure the site is not blocked from storing data.

The download finished with failed files

Why: some files could not be fetched, usually because of a brief network problem.

What to do: select **Repair cache** while online.

Persistent storage stays "best-effort"

Why: the browser decides whether to grant it. Some grant it only to installed apps or sites you use often.

What to do: install the app, keep using the site, and check again. Until then, keep some free space on the device so the browser has no reason to clear the offline copy.

A page says "You are offline"

Why: that page was not stored before the connection dropped.

What to do: open one of the pages listed under **Saved on this device**, or select **Try again** when you are back online. Next time, prepare a larger profile.

The site seems out of date

Why: an update is waiting, or your offline copy predates a release.

What to do: select **Refresh** on the **Update ready** prompt, **Update app** on the Download page, or press **Ctrl + Shift + U**. Then prepare the offline version again.

Storage is nearly full

What to do: choose **Lite** or **Balanced**, select **Reset cache** and prepare again, or free space on the device.

iPhone or iPad cleared the offline copy

Why: mobile Safari limits storage for websites and may clear it for sites that have not been used for a while.

What to do: add the site to your Home Screen, open it regularly, and prepare the offline version again when needed.

Download and offline FAQ

Short answers about installing Auric Artisan and using it offline.

Is there a desktop app to download?

The app is installed from your browser, not downloaded as a separate program. It then runs in its own window. The browser extension and the VS Code extensions are separate products.

Is the app free?

Yes. Installing and using it offline costs nothing. Every tool is free on every plan.

Does the installed app need an account?

No. An account is needed only for account features, which also need a connection.

Do my saved palettes work offline?

Yes. Your library is kept on your device and works offline.

Does the app update itself?

Yes, from the website. When a new version is ready you are asked to refresh; see [Updates](#).

Can I install it on more than one device?

Yes. Install and prepare it on each device. Your library and settings stay on each device separately, unless you use account features that sync them.

How much space does it need?

It depends on the profile. Lite is small; Full can take more than 100 MB. The **Storage used** figure on the Download page shows your actual use.

Which browsers work best?

For installing: Chrome and Edge on desktop and Android, and Safari on iPhone and iPad (Add to Home Screen) and on macOS (Add to Dock). For offline use: any current browser with service workers on a secure connection.

Download and offline: supporting material

Contents of the download and offline supporting files.

File	What it covers
glossary.md	Terms used in the download and offline guides
limits-and-accuracy.md	Platform limits, storage, and what the page's figures mean
related.md	Related features and products
privacy.md	What is stored on your device and what the page reads
release-notes.md	User-facing history

There are no shortcuts specific to the Download page. **Ctrl** + **Shift** + **U** applies a waiting website update from any page.

Download and offline glossary

Terms used in the download and offline guides.

Term	Meaning
PWA	Progressive web app: a website a browser can install like an app and run offline.
Install	Adding the site to your device as an app with its own window and icon.
Standalone	Running in its own window without the browser's toolbar.
Service worker	A part of the site that runs in your browser and serves stored files when you are offline.
Cache	The browser's store of site files kept for offline use.
App shell	The small core of pages, styles and scripts stored automatically on your first visit.
Offline profile	How much of the site to store: Auto, Lite, Balanced or Full.
Persistent storage	Browser storage that is not cleared automatically when space runs low.
Best-effort storage	Browser storage that the browser may clear when space runs low.
Quota	The amount of storage the browser allows the site to use.
Audit	A check of which files of your profile are stored and which are missing.
Background sync	A browser feature that finishes a task, such as a download, when you are next online.
Share target	An app that appears in your device's share menu.

Download and offline limits and accuracy

Platform limits, storage limits, and what the Download page's figures do and do not tell you.

Platform limits

- **Installing** depends on the browser. Chrome and Edge offer it on desktop and Android; Safari offers Add to Home Screen on iPhone and iPad and Add to Dock on macOS; Firefox on desktop does not install web apps.
 - **Offline use** needs a browser with service workers and a secure (https) connection. It does not work in browsers or modes that block service workers or site storage.
 - **Mobile Safari** limits how much a website may store and may clear it if the site is not used for a while.
 - **App shortcuts, file opening, sharing to the app and link types** work only where the system and browser support them, mostly Chromium-based browsers and Android.
 - **Background sync**, which finishes interrupted downloads, is available only in some browsers.
-

Storage

- The browser sets the site's quota. The **Storage used** figure shows use and quota as the browser reports them.
 - Without persistent storage, the browser may clear the offline copy when the device is short of space.
 - **Reset cache** clears only the offline copy. Your library, settings and recordings are separate.
-

What the figures mean

- **Cache entries** counts stored files; it includes pages you visited as well as prepared files.
 - **Cache target** is the number of files in the profile for the current release; it changes between releases.
 - **Local CPU, device memory** and **Graphics** are what the browser chooses to report. Some browsers report less, or round the figures, for privacy.
 - **Offline ready** means every file of your profile is stored, as of the last check. It does not mean that features needing a server work offline.
 - Auto's choice is based on the reported figures and connection type at the moment you prepare.
-

What offline cannot do

Signing in, account data, live website audits, web search, installing and updating need a connection. See [What works offline](#).

WEBSITE > DOWNLOAD AND OFFLINE

Download and offline privacy

What the installed app and offline copy store on your device, and what the Download page reads.

Stored on your device

- The offline copy of the site's files, in your browser's storage for auricartisan.com.
- Your profile choice, the low-power switch, and whether you have asked for an offline copy (so an interrupted or out-of-date copy can be completed later).
- Files you open with the installed app, or text and links you share to it, are held on your device for the Workspace to pick up.

What the Download page reads

The page reads your device's processor thread count, approximate memory, graphics processor name, connection type and storage estimate, as your browser reports them. It uses them to show the metrics and to choose the Auto profile. It does not send them to Auric Artisan.

What uses the network

- Downloading the offline copy and updates, from auricartisan.com.
- Checking for updates.

Removing it

Select **Reset cache** on the Download page, uninstall the app, or clear the site's data in your browser (see [Uninstall and remove data](#)).

Download and offline release notes

User-facing history of the installable app and offline support, from the public changelog.

Date	Release	Change
2026-06-05	v0.9.9	Added PWA app support, alongside user settings controls, guide content and the UX Kit.

The Download page as documented here (readiness checks, live metrics, the Auto, Lite, Balanced and Full profiles, and audit, repair and reset) reflects the site as of September 2026, app version **2026-09-24-pwa-303**. The **PWA version** figure on the Download page shows the version in your browser. See <https://auricartisan.com/library/changelog/> for later releases.
